Conclusion

Find all patients born in or after 1970.

```
SELECT p.person_id  
FROM person p  
WHERE p.year_of_birth >= 1970
```

```
function find_patients(conn)  
  sql = ""  
  SELECT p.person_id  
  FROM person p  
  WHERE p.year_of_birth >= 1970  
  ""  
  DBInterface.execute(conn, sql)  
end
```

Find all patients born between *and*

```
function find_patients(conn; start_year = nothing, end_year = nothing)
  sql = ""
  SELECT p.person_id
  FROM person p
  ""
  predicates = String[]
  if start_year != nothing
    push!(predicates, "p.year_of_birth >= $start_year")
  end
  if end_year != nothing
    push!(predicates, "p.year_of_birth <= $end_year")
  end
  if !isempty(predicates)
    sql *= "\nWHERE " * join(predicates, " AND ")
  end
  DBInterface.execute(conn, sql)
end
```

```
function find_patients(conn; start_year = nothing,  
                        end_year = nothing,  
                        state = nothing,  
                        condition_concepts = [],  
                        latest_visit_threshold = nothing)
```

```
    sql = ???
```

```
    DBInterface.execute(conn, sql)
```

```
end
```

DONE

- Select, Where, Join, Define, Group, Partition, Append (UNION ALL), Parameterized and Correlated Queries
- Tested with SQLite, PostgreSQL, RedShift, Microsoft SQL Server

TODO (June 2021)

- ORDER BY and LIMIT, CTE and WITH clause, WITH RECURSIVE, CUBE/ROLLUP and more
- Documentation and examples
- Comprehensive support for SQL dialects
- Tracking column and expression types
- CRUD (INSERT, UPDATE, DELETE)
- DDL (CREATE TABLE) and schema introspection

Example
